### AMENDMENTS

#### To the Specification:

[0004] The conventional computer system is composed of a display, a computer host and some electrically connected peripherals. Peripherals operated by the user are restricted by the range of the computer desk. The fast development of the computer industry, plus the broad application of the Internet, has connected computers to the daily lives of many people. In addition, competition and the demand for light, thin, short and small exterior features continuously demands for the enhancement of operation speed and convenience in the industry. The peripheral-related-industry relating to the peripherals of the computer system has developed some wireless input apparatus such as a wireless mouse, wireless keyboard, and has even converted USB interfaced peripherals into wireless peripherals. Such apparatus provides operation convenience for the user, by reducing the problems of wire connection.
